

IVY (HEDERA WOERNER) SCREEN PRICES

Cost per Ivy screen 1.2m wide x 1.8m high. –

£145.80 ex V.A.T. (**£175.00 including V.A.T.**)

Free delivery on all orders over 8 screens and above.

Orders up to 8 screens there is an additional pallet delivery price of £60.00 + V.A.T.

40 + units please call for bulk order discount

If you do not have offloading facilities, please call or email the office (see below)

Also please note all prices include delivery by pallet, except for a few postcode areas.

Telephone 01752 829178 or email eastofedenplants@yahoo.co.uk

Planting East of Eden Living Screens in the ground

The working length per screen with support posts is 1.38m

For example: For 20 meter run you will require $20 / 1.38 = 14.49$ ie either 15 screens, if you have the space, or 14 screens leaving a small gap

The screens can be attached to the posts with tree ties, but if you would like the galvanised security brackets, they are £2.50 including V.A.T. each. (4 required for each screen - see installation guide attached)

The conventional posts that are used are 75 x 75cm x 2.4m posts, with 1.8m above ground. Most people use tanalised softwood, but I prefer to recommend them to be made from Larch, which have a much longer life and do not contain the toxic tanalised chemical preservatives. If you cannot obtain them, we can supply them from sustainably sourced woodlands.

A smart alternative post style is to use fabricated galvanised and power coated (dark green) round metal posts, which only need to 50mm diam.(See the pdf)

Planting East of Eden Natural Screens in bespoke troughs

There are many situations when the Living screens cannot be planted directly into the ground. For these situations we recommend the use of our bespoke sustainably produced Larch planters with posts. See the attached pdf for details..

Planter cost: Each larch planter, made to commercial quality standard, including larch support posts and internal larch post fittings is £165 ex VAT.

Delivery of the troughs is by pallet separate from the living screens. Please call or email for a quote, as it depends on the number ordered and postcode.

Number of trough units required for your project:

Using our bespoke larch planters, with internal support posts, as featured in the attached Living Green Screen pdf, the complete planter and screen is **1.35m**. Hence divide the length required for screening by 1.35 for the number of screens and troughs required.

If you have a length not perfectly divisible by 1.35, we have optional solutions for complete screening. Please call us or email regarding your specific requirements

Although we advise use of the Larch planters, we can supply bespoke trough planters from other materials. (See Ivy Screens in troughs pdf)

The Ivy screens are very smart in appearance. We have used them in RHS show designs at Hampton court and Chelsea. Within a year the growth will provide, not only an instant natural screen 1.8m above ground, but at a much lower cost than any other form of 1.8m high instant hedge screen, with the benefits of significantly improving air quality, increased Biodiversity, but with the advantage of offering a high security boundary

East of Eden Living Green Screen species

The Ivy screens are the most reliable instant species, and can withstand anything the British climate throws at it, as long as they are irrigated or regularly watered in the first year, which is standard practice with any new hedge.

As they are a native species, Ivy screens are also good for Biodiversity, which is a plus for the planning dept. Finally, their root systems form a continuous run, and absorb flash flood water run-off more effectively than the more compact root-balls of instant hedge species, and in contrast to fence and wall perimeters boundary alternatives. Again, another plus for the environment, as well as the Planning application process.

Alternative Living Screen species: Although the Ivy screens are the most economic and hardy natural evergreen screen option, we can also supply other natural screen species, including a recent very reliable and attractive evergreen option of Euonymus (See attached Ivy (Hedera) Screen pdf)...

By using the correct fixing brackets (see pdf), they form a continuous impenetrable high security screen. Even the most dense hedge can be walked through, with little effort, but our Living screens on security frames with security fixing brackets, will confound and prevent entry by most intruders.

NOTE: - It is highly advisable to:-

1. Apply Professional Rootgrow when planting, which we can supply if you cannot locate the commercial product
2. To install an inexpensive 'drip' or 'leaky pipe' irrigation system, to help them establish in the first year. (Standard advice for any newly planted mature hedge) Again we can supply an appropriate system and timer if required, or recommended suppliers
